

# Catecholamine Research

## *The Enduring Impact of Irv Kopin*

Natcher Conference Center, NIH, Bethesda, MD

Thursday July 26, 2018

Website: <https://meetings.ninds.nih.gov/meetings/kopin/>

The catecholamines dopamine, norepinephrine, and epinephrine participate in a wide range of behaviors, physiological mechanisms, drug actions, and neurological, psychiatric, endocrine, and cardiovascular diseases. Myriad investigations based on this family of compounds over more than a century have yielded an enormous body of knowledge and led to many Nobel Prizes. This symposium honoring the memory of Dr. Irwin J. (“Irv”) Kopin will include a series of state-of-the-art lectures by world authorities in this field and, importantly a poster session that will provide a highly unusual opportunity for generations of catecholamine researchers to meet and interact with each other in a collegial setting. As such, the symposium will serve to foster the careers of young investigators doing catecholamine-related research.

**TRAVEL STIPENDS are available for junior researchers (e.g., graduate student, post-doc, Assistant Professor) to present their research. The application package should contain the Abstract (formatted per instructions at the website), a cover letter explaining the role in the research and career goals, CV, and letter of recommendation by the mentor/supervisor. Decisions will be on a rolling basis. For more info contact Dr. David S. Goldstein at [goldsteind@ninds.nih.gov](mailto:goldsteind@ninds.nih.gov).**
